Financial Analysis 2025

Dataset intelligence report · annual-enterprise-survey-2025-financial-year-provisional.csv

Executive summary

This report profiles 60,255 records across 10 fields. Year averages 2,019 across the full dataset, with observed values from 2,013 to 2,025. In a bounded sample of 2,500 records, the median is 2,025, and the middle half falls between 2,025 and 2,025. No missing values were reported in the imported dataset profile.

60,255 Rows	**10** Columns	**Large** Report depth	**11** Pages planned

Key findings

- The most common Variable_category value is Financial performance (30,121 rows).

Report scope

Use the executive summary for the main findings, the field guide for dataset scope and quality, then the measure and category sections for supporting evidence. Each plot has a clear title, a plain-language caption, and an interpretation. Sample-based plots state their row count; likely sensitive fields are omitted.

Dataset structure and quality

The source has 60,255 records and 10 fields. The field guide below focuses on non-sensitive columns.

Field	Type	Missing	Distinct values	Observed range
Year	int	0.0%	13	2013 to 2025
Industry_aggregation_NZSIOC	str	0.0%	3	—
Industry_code_NZSIOC	str	0.0%	139	—
Industry_name_NZSIOC	str	0.0%	119	—
Units	str	0.0%	3	—
Variable_code	str	0.0%	39	—
Variable_name	str	0.0%	41	—
Variable_category	str	0.0%	3	—
Value	str	0.0%	15,858	—
Industry_code_ANZSIC06	str	0.0%	119	—

Data quality review

- No missing values were reported in the imported dataset profile.
- 0 potentially sensitive field(s) were excluded from report examples and charts.

Numeric measures

Averages summarize typical values, minimum and maximum show the observed range, and standard deviation describes spread. Missing percentages show how much data is unavailable for each measure.

Measure	Average	Minimum	Maximum	Std. dev.	Missing
Year	2,019	2,013	2,025	3.74	0.0%

Measure interpretation

- Year averages 2,019 across observed values from 2,013 to 2,025.

Distribution snapshot

Quartiles below summarize a bounded sample of 2,500 records for Year. The middle half of sampled values lies between the 25th and 75th percentiles.

Measure	Sample rows	25th percentile	Median	75th percentile	Middle spread
Year	2,500	2,025	2,025	2,025	0

Use the quartiles with the full-dataset minimum, maximum, and average above. The sample describes the distribution; it does not replace the full-dataset measures.

Category patterns

Counts show how often each label occurs and whether a comparison is supported by many records. Small groups can have less stable averages; a difference between groups does not establish a cause.

Field	Value	Records	Share of dataset
Variable_category	Financial performance	30,121	50.0%
Variable_category	Financial position	17,251	28.6%
Variable_category	Financial ratios	12,883	21.4%
Industry_aggregation_NZSIOC	Level 4	32,981	54.7%
Industry_aggregation_NZSIOC	Level 3	20,007	33.2%
Industry_aggregation_NZSIOC	Level 1	7,267	12.1%
Units	Dollars (millions)	47,372	78.6%
Units	Percentage	9,581	15.9%
Units	Dollars	3,302	5.5%

Average by group

Group	Average	Records	Share of rows	Difference vs overall
Financial performance	2,019	30,121	50.0%	0
Financial position	2,019	17,251	28.6%	0
Financial ratios	2,019	12,883	21.4%	0

Plot Report

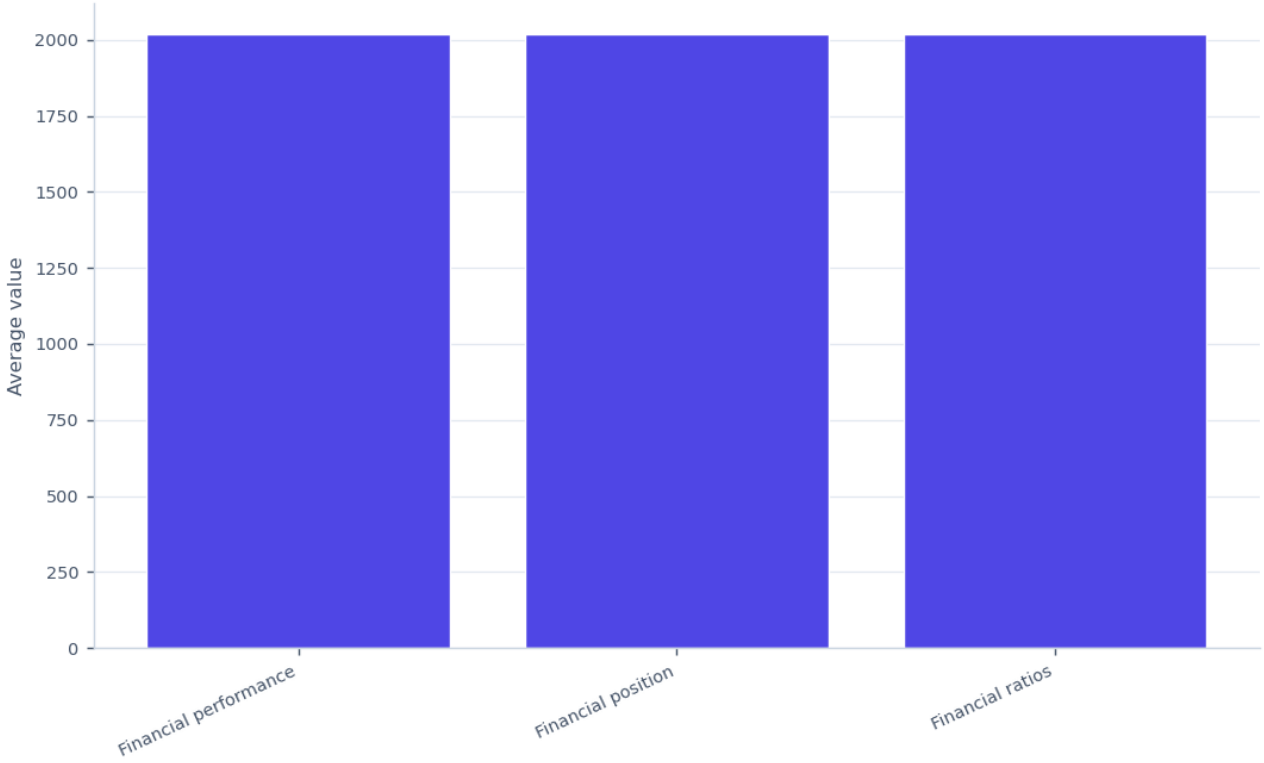

Average Year by Variable_category

Each bar shows the full-dataset average Year for a Variable_category group.

Purpose: Compare the average Year across Variable_category.

Useful for: Find stronger or weaker segments while checking whether each comparison has enough records.

What the data shows: Financial performance has the highest plotted average at 2,019, while Financial performance is lowest at 2,019; the difference is 0.

Group	Average	Records	Share of groups
Financial performance	2,019	30,121	50.0%
Financial position	2,019	17,251	28.6%
Financial ratios	2,019	12,883	21.4%

How to read this plot: The bars compare the average shown for each group. Group sizes are Financial performance: 30,121 records; Financial position: 17,251 records; Financial ratios: 12,883 records. Read the averages alongside these counts; the comparison shows association, not cause.

Plot Report

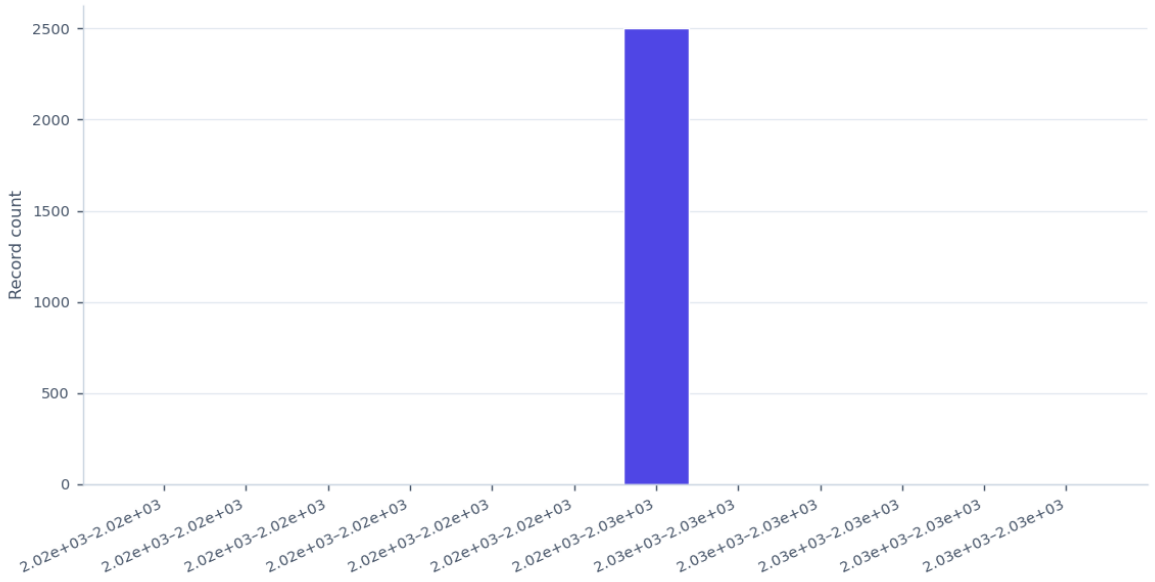

Distribution of Year

The histogram shows Year values in a bounded sample of 2,500 rows.

Purpose: Show how Distribution of Year is distributed across value ranges in the plotted sample.

Useful for: Assess concentration, spread, unusual ranges, and whether an average represents a typical record.

What the data shows: The most populated range is 2.02e+03–2.03e+03, containing 2,500 records (100.0% of the plotted sample).

Value range	Sample records	Share of sample
2.02e+03–2.02e+03	0	0.0%
2.02e+03–2.02e+03	0	0.0%
2.02e+03–2.02e+03	0	0.0%
2.02e+03–2.02e+03	0	0.0%
2.02e+03–2.02e+03	0	0.0%
2.02e+03–2.02e+03	0	0.0%
2.02e+03–2.03e+03	2,500	100.0%
2.03e+03–2.03e+03	0	0.0%
2.03e+03–2.03e+03	0	0.0%
2.03e+03–2.03e+03	0	0.0%
2.03e+03–2.03e+03	0	0.0%
2.03e+03–2.03e+03	0	0.0%

How to read this plot: The bars show how many sampled records fall into each value range. Taller bars identify the most common ranges; gaps can indicate rare values. The pattern describes this sample and does not explain why the values occur.

Plot Report

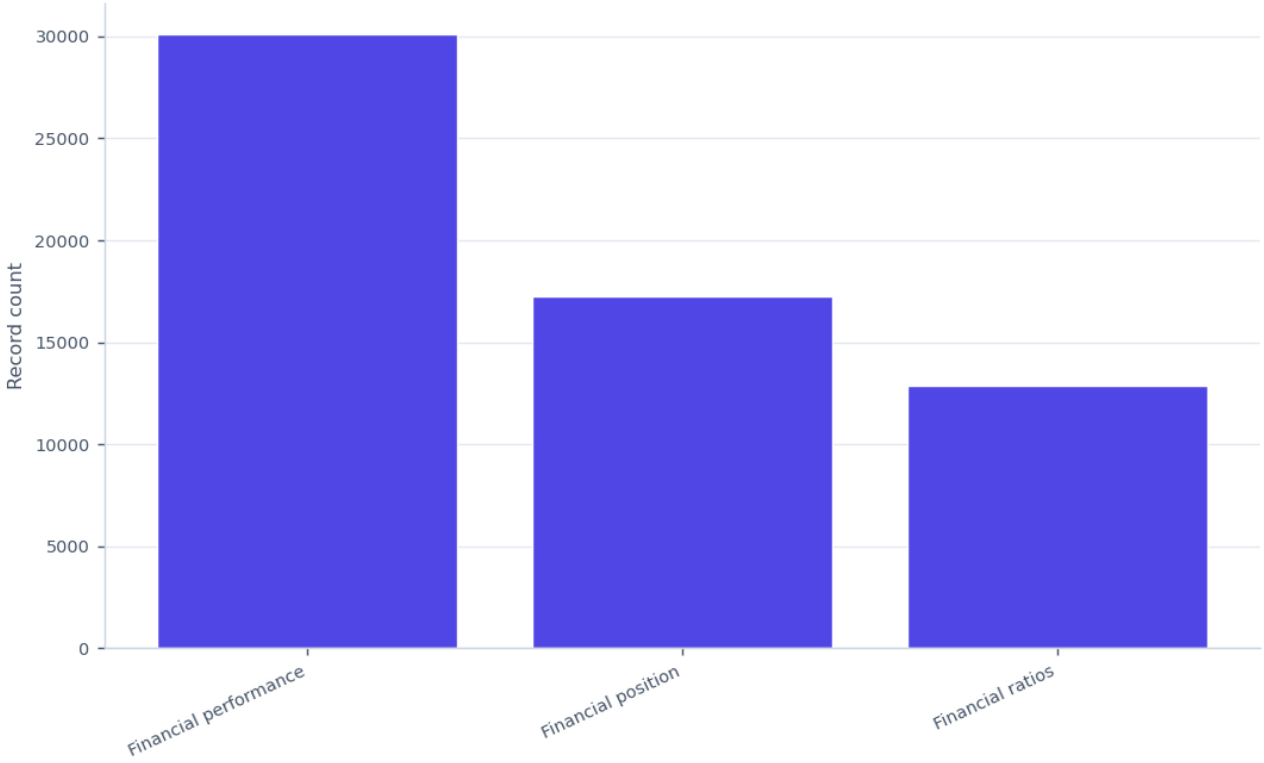

Most common Variable_category values

Record counts for the most common Variable_category labels across the dataset.

Purpose: Show the composition of the dataset across the displayed categories.

Useful for: Identify dominant segments, concentration, and categories that may need separate investigation.

What the data shows: Financial performance is the most frequent plotted category with 30,121 records (50.0% of the displayed total).

Category	Records
Financial performance	30,121
Financial position	17,251
Financial ratios	12,883

How to read this plot: Each bar represents the record count for one category. The tallest bars are the most common values in the dataset; they do not indicate that those categories perform better.

Analytical interpretation

This section translates the visuals into observations and decision questions. The findings describe patterns in the data; they do not establish causation.

Average Year by Variable_category

Purpose: Compare the average Year across Variable_category.

Useful for: Find stronger or weaker segments while checking whether each comparison has enough records.

Observed finding: Financial performance has the highest plotted average at 2,019, while Financial performance is lowest at 2,019; the difference is 0.

Distribution of Year

Purpose: Show how Distribution of Year is distributed across value ranges in the plotted sample.

Useful for: Assess concentration, spread, unusual ranges, and whether an average represents a typical record.

Observed finding: The most populated range is 2.02e+03–2.03e+03, containing 2,500 records (100.0% of the plotted sample).

Most common Variable_category values

Purpose: Show the composition of the dataset across the displayed categories.

Useful for: Identify dominant segments, concentration, and categories that may need separate investigation.

Observed finding: Financial performance is the most frequent plotted category with 30,121 records (50.0% of the displayed total).
